

## Does an Egg Float?

### Things you will need:

- 2 eggs
- 2 see through containers
- Salt
- Water

### Instructions:

Fill one container with water, place the egg in it and watch it sink to the bottom. Then fill the other container with salt water. Place the other egg in this container and see what happens.

### The science behind it:

An egg will sink in normal water because the density of water is less than the density of an egg. However when you add salt to water it increases the density which then makes it more dense than the egg.
